

Case Study — Daily Macro Brief Agent

Format: Take-home, 7 days; **Estimated effort:** 10–15 hours;
Deliverables: GitHub repo + 1-page Memo

Background

We are a small investment firm focused on **macro investing**. Our decision-maker (referred to below as the **PM**) has a short window before the market opens each morning that is his highest-density information moment of the day.

We would like you to build a prototype that **automatically sends a Daily Macro Brief at an agreed time each day** to a designated email inbox (or Telegram — your choice).

Reader profile

The PM is macro-trained, has no patience for long reads, and wants:

| *"What changed overnight + so what for our book."*

He already subscribes to mainstream financial media (Bloomberg, FT, etc.), so **do not regurgitate second-hand news** — we want **synthesis, selection, and a point of view**.

On data assumptions (important)

Some information you will not have — for example, our current positions, book risk exposures, the specific themes we follow internally, etc.

When you hit one of these gaps, **make reasonable assumptions or generate sample data**. For example, assume we are long USD/JPY, overweight gold, and run an EM debt basket; or invent a plausible "house view" list. Briefly state your assumptions in the Memo. We care about **how you handle incomplete information**, not how accurately you guess.

Required modules (order is up to you)

1. **Overnight market dashboard** — US/EU close vs. prior day across equities, rates, FX, gold, oil, BTC. Use a table, not a chart.
2. **The 3 things that matter today** — your pick of the 3 things the PM must know today. Each ≤ 80 words, with a clear *"so what"*.
3. **Today's calendar** — key data and events across Asia / EU / US sessions, including consensus estimates.
4. **One chart worth seeing** — embed one chart (generated or scraped), with a caption ≤ 30 words.
5. **Theme radar** — 1–3 deep-content summaries tied to your assumed positions / themes. Sources should favor **non-mainstream** material (research notes, Substacks, podcasts, X threads, central bank speeches, buy-side letters, etc.). For each item:
 - Title + source + link
 - 60–100 word summary (the author's **thesis and evidence**, not just the abstract)
 - One line: **"What this means for our book."**
6. **Contrarian corner** — 50–100 words on a narrative the market is not pricing but you think is worth watching.

Technical constraints (intentional)

- **Must be able to deploy easily and can actually run on schedule** every day after following simple set up.
- **Do not use the LLM to generate market data** — numbers must come from real APIs or scraping. The LLM is for synthesis and writing only.

Deliverables

1. **GitHub repo** (public or invite us as collaborators):
 - Code + README
 - A `costs.md` documenting daily run cost (tokens + hosting)
2. **1-page Memo (PDF)** covering:
 - Design tradeoffs (why these modules, these data sources, this LLM)
 - The position / theme **assumptions** you made
 - 3 v2 features you wanted to add but did not have time for
 - Where you think the project could go if you had **1 month full-time**
 - The **actual hours** you spent (honest answer; does not affect scoring)
